

Enterprise AI Knowledge Chatbot - Sample Q&A; Dataset

Q: What is Enterprise AI?

A: Enterprise AI refers to the integration of artificial intelligence technologies into business processes to improve efficiency, decision-making, and automation.

Q: What is a Knowledge Chatbot?

A: A knowledge chatbot is an AI system that answers user queries by retrieving relevant information from documents or a knowledge base.

Q: How does document-based question answering work?

A: The system processes uploaded documents, converts them into embeddings, and retrieves relevant sections based on user queries to generate accurate answers.

Q: What are embeddings in AI?

A: Embeddings are numerical representations of text that capture semantic meaning, allowing similarity comparison between queries and documents.

Q: What is a vector database?

A: A vector database stores embeddings and enables fast similarity search to retrieve relevant information.

Q: What is the role of NLP in chatbots?

A: Natural Language Processing helps the chatbot understand, interpret, and respond to user queries in human language.

Q: How does semantic search differ from keyword search?

A: Semantic search understands context and meaning, while keyword search matches exact words.

Q: What are the benefits of Enterprise AI chatbots?

A: They improve productivity, provide instant answers, reduce manual effort, and enhance decision-making.

Q: What types of files can be used?

A: Typically PDF, text, and document files are supported for knowledge extraction.

Q: What is Retrieval-Augmented Generation (RAG)?

A: RAG combines document retrieval with AI-generated responses to provide accurate and context-aware answers.
